

API Integration

Integrating your tool into the Virtual Store is easy!

With REST (Representational State Transfer) technology, our API has been made in accordance with the best practices of the internet to facilitate the development and simplify its integration.

The Virtual Store uses JSON as its only format for input and output that is simpler and lighter than XML.

Registering / editing products via API

We are ready to receive the products directly from your company's ERP.

Through the API it is possible to send or update all products registered in your system at one time, ensuring much more agility and safety, since the product data is verified and validated before being recorded.

Capturing / editing requests via API

Orders placed in the Virtual Store are available to be captured by ERP, CRM systems and others. This way you can track your Virtual Store requests on your favorite system.

Updating request situations via API

We provide the necessary resources to update the ordering situations by your external system, so it is no longer necessary to update the orders in more than one tool.

Capturing / editing clients via API

Customer registrations in the Virtual Store are available to be captured by ERP, CRM systems and others. This way you can control the customers of the Virtual Store in your favorite system.
